Make room for stillness.

A conceptual pavilion study organized around arrival, shelter and a framed view.

Concept model; not a construction document

The space unfolds in three moments.

01

A compressed threshold.

02

An open sheltered room.

03

A framed view outward.

Structure and enclosure play different roles.

Primary structure

Define a legible load path and a restrained set of supporting elements.

Secondary enclosure

Filter light and frame views without obscuring the spatial organization.

Light is a material that changes.

Study the opening across different sun angles before fixing its proportions.

Test the space, not just the image.

Next studies: circulation, accessibility, climate response and a physical or digital section model.
