Capture the field.
Keep the context.

An offline research-terminal concept for organizing observations when connectivity is unreliable.

Industrial-design concept; not a real product

Design around the research session.

01

Capture notes locally.

02

Attach time and context.

03

Review before syncing.

Offline-first is a product decision.

During collection

Show local save state. Avoid suggesting that an unsynced note is backed up remotely.

During reconciliation

Expose conflicts. Let the researcher resolve meaning rather than silently replacing text.

Trust is a visible system state.

A save indicator should communicate what has actually happened, not merely that a button was pressed.

Validate the workflow before the feature list.

Next research: observe a field session, prototype interruptions and test recovery with participants.
